

R1-m11: what each published MAGICC timing actually measured

Hatched bar is not a measurement: it is 1,000 genomes divided by 1,451 genomes/min/thread, which was itself the arithmetic MEAN OF FIVE PER-SET RATES computed from MAGICC's internal compute-phase timer (feature extraction + inference only). Pooled over the same five sets that timer gives 1,066 genomes/min/thread, not 1,451.
